

Vision 2030 AI Readiness Framework

Technical Report: A Research Prototype for Institutional AI Readiness Assessment

July 2026 Version 1.0

Abstract

The Vision 2030 AI Readiness Framework is an open-source research prototype developed to investigate how institutions can systematically assess their preparedness for responsible artificial intelligence adoption. This framework introduces a multi-dimensional assessment model integrating five strategic domains: digital infrastructure, human capital, AI governance, innovation ecosystem, and the data economy. Using a configurable weighted scoring methodology, the model identifies capability gaps and supports structured decision-making. The primary contribution of this work is the provision of a transparent, open-source, and extensible platform that serves as a foundational tool for institutional benchmarking and policy analysis.

Keywords: Artificial Intelligence, AI Readiness, Trustworthy AI, AI Governance, Digital Transformation, Decision Support Systems, Institutional Assessment, Open-Source Research.

Introduction

In the contemporary landscape of digital transformation, the integration of Artificial Intelligence (AI) into core institutional operations is a strategic imperative. However, successful adoption depends not only on technical capability but also on institutional readiness, governance, and organizational capacity. This project addresses the gap between technical potential and governance maturity by providing a transparent, metrics-driven readiness assessment framework.

Research Problem

How can institutions systematically evaluate their readiness for responsible AI adoption while ensuring transparency, governance, and effective human oversight? The challenge lies in synthesizing qualitative governance frameworks with quantitative technical indicators.

Research Objectives

1. Design a structured AI readiness assessment framework.
2. Integrate multiple institutional dimensions into a unified evaluation model.
3. Develop an interpretable weighted scoring methodology.
4. Support evidence-informed institutional decision-making.
5. Provide an open-source research prototype for future investigation and collaborative benchmarking.

Methodology

The framework evaluates capacity across five pillars. To ensure consistency, all indicators undergo **Min-Max Normalization** to a $[0, 1]$ scale. The composite readiness score (S) is calculated as:

$$S = \sum_{i=1}^n w_i \cdot s_i \quad (1)$$

Where s_i represents the normalized score of pillar i , and w_i represents the weight assigned to pillar i . Weights are configurable while maintaining the constraint $\sum w_i = 1$, ensuring comparability across different assessment scenarios and allowing for institutional strategic alignment.

System Architecture

(Insert Figure 1 here: Flowchart from Data Sources to Dashboard) The framework architecture follows a sequential pipeline: Data Ingestion $\rightarrow$ Normalization $\rightarrow$ Pillar Aggregation $\rightarrow$ Weighted Scoring $\rightarrow$ Visualization.

Results & Demonstration

Using an illustrative example based on institutional pilot scenarios, the model reveals a high score in 'Digital Infrastructure' (0.85) and a relative gap in 'AI Governance' (0.30). These results are indicative of potential readiness trajectories and are intended to assist leaders in prioritizing domain-specific investments.

Limitations

The model relies on publicly available indicators which may not capture real-time internal organizational nuances. It serves as a diagnostic decision-support tool rather than an automated implementation roadmap.

Future Work

Future work will focus on validating the framework through institutional case studies, refining the weighted scoring methodology using empirical evidence, and exploring predictive models to project AI readiness trajectories.
